# 1.5MHz 1A, Synchronous Step-Down Regulator

#### **General Description**

EML3493 is a high efficiency step down DC/DC converter. It features an extremely low quiescent current, which is suitable for reducing standby power consumption, especially for portable applications.

The device can accept input voltage from 2.5V to 5.5V and deliver up to 1A output current. High 1.5MHz switching frequency allows the use of small surface mount inductors and capacitors to reduce overall PCB board space. Furthermore, the built-in synchronous switch improves efficiency and eliminates external Schottky diode. EML3493 uses different modulation algorithms for various loading conditions: (1) Pulse Width Modulation (PWM) for low output voltage ripple and fixed frequency noise, (2) Pulse Frequency Modulation (PFM) for improving light load efficiency, and (3) Low Dropout (LDO) Mode for providing 100% duty cycle operation during heavy loading. Adopting low reference voltage design reduces regulated output to 0.6V. The adjustable version of this device is available in SOT-23-5 package.

#### **Features**

■ Achieve 97% efficiency

■ Input voltage: 2.5V to 5.5V

Output current up to 1A

■ Reference voltage: 0.6V

■ Quiescent current 15µ A with no load

■ Internal switching frequency: 1.5MHz

No Schottky diode needed

■ Low dropout operation: 100% duty cycle

■ Shutdown current < 1µ A

Excellent line and load transient response

Over-temperature protection

#### **Applications**

- Blue-Tooth devices
- Cellular and Smart Phones
- Personal Multi-media Player (PMP)
- Wireless networking
- Digital Still Cameras
- Portable applications

#### **Pin Functions**

Pin Name	SOT-23-5	Function	
RUN	1	Enable Pin. Minimum 1.2V to enable the device. Maximum 0.4V to shut	
KUN		down the device.	
VIN	4	Power Input Pin. Must be closely decoupled to GND pin with a $4.7\mu F$ or	
VIN		greater ceramic capacitor.	
sw	3	Switch Pin. Must be connected to Inductor. This pin connects to the drains	
		of the internal main and synchronous power MOSFET switches.	
GND	2	Ground Pin.	
VFB	-	Feedback Pin. Receives the feedback voltage from an external resistive	
(Adjustable)	5	divider across the output.	

#### **Absolute Maximum Ratings**

Devices are subjected to fail if they stay above absolute maximum ratings.

Input Voltage 0.3V to 6V
RUN, VFB Voltages 0.3V to $V_{\text{IN}}$
SW(DC) Voltage $-0.3V$ to $(V_{IN} + 0.3V)$
SW(AC, less than 20ns) Voltage 3V to 7.5V
Lead Temperature (Soldering, 10 sec) 260°C

Operating Temperature Range
Junction Temperature (Notes 1, 2) 150°C
Storage Temperature Range 65°C to 150°C
ESD Susceptibility HBM 2KV

Note 2: This IC has a built-in over-temperature protection to avoid damage from overloaded conditions.

**Note 3:**  $\theta$  <sub>JA</sub> is measured in the natural convection at  $T_A$ =25°C on a highly effective thermal conductivity test board (2 layers , 2SOP) according to the JEDEC 51-7 thermal measurement standard.

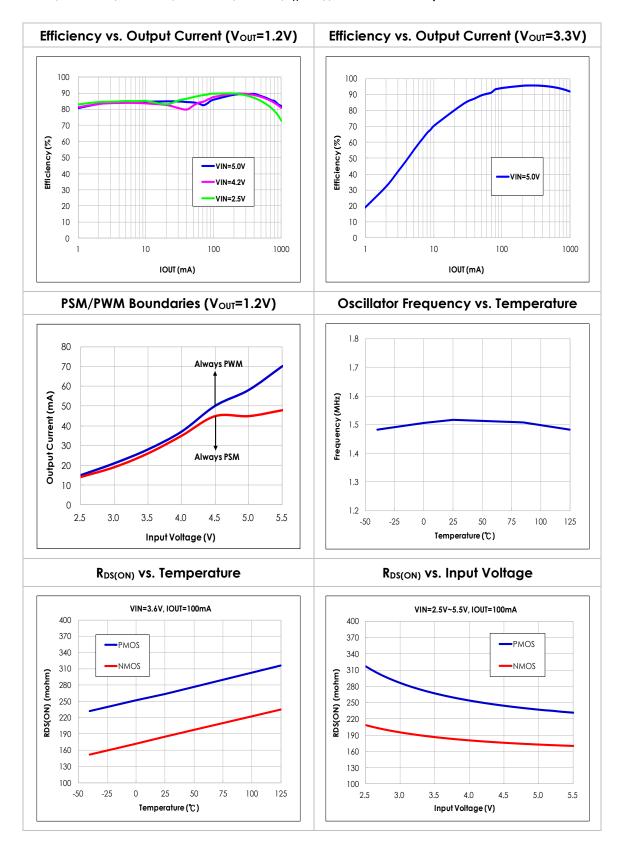

**Note 4:**  $\theta$   $_{JC}$  represents the heat resistance between the chip and the package top case.

Note 5: Design guaranteed.

#### **Applications**

The typical application circuit of adjustable version is shown in Fig.1.

#### **Inductor Selection**

Inductor ripple current and core saturation current are the two main factors that decide the Inductor value. A low DCR inductor is preferred.

#### CIN and COUT Selection

A low ESR input capacitor can prevent large voltage transients at  $V_{IN}$ . The RMS current of input capacitor is required larger than  $I_{RMS}$  calculated by:

$$I_{RMS} \cong I_{OMAX} \frac{\sqrt{V_{OUT}(V_{IN} - V_{OUT})}}{V_{IN}}$$
 Eq. 1

ESR is an important parameter to select  $C_{\text{OUT}}$ , which can be seen in the following output ripple  $V_{\text{OUT}}$  equation:

$$\Delta V_{OUT} \cong \Delta I_{L} \left( ESR + \frac{1}{8 \cdot f \cdot C_{OUT}} \right)$$
 Eq. 2

Cheaper and smaller ceramic capacitors with higher capacitance values are now commercially available. These ceramic capacitors have low ripple currents, high voltage ratings and low ESR which make them suitable for switching regulator applications. It is feasible to optimize very low output ripples by Cout since Cout does not affect the internal control loop stability. X5R or X7R types are recommended since they have the best temperature and voltage characteristics of all ceramics capacitors.

#### Output Voltage (EML3493 adjustable)

In the adjustable version, the output voltage can be determined by:

$$V_{OUT} = 0.6 V \left( 1 + \frac{R_2}{R_1} \right)$$
 Eq. 3

#### **Thermal Considerations**

Although the thermal shutdown circuit is designed in EML3493 to protect the device from thermal damage, the total power dissipation that EML3493 can sustain depends on the thermal capability of the package. The formula to ensure the safe operation is shown in note 1 on page 5.

To avoid the EML3493 from exceeding the maximum junction temperature, the user should perform some thermal analysis during PCB design.

#### **Guidelines for PCB Layout**

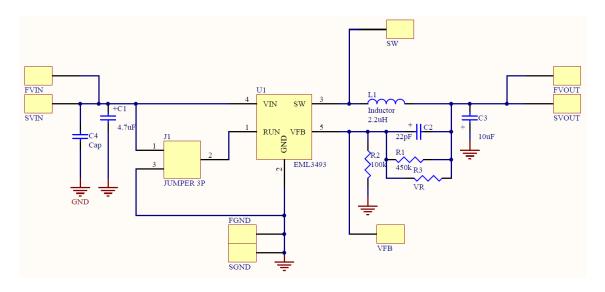

To ensure proper operation of the EML3493, please note the following PCB layout guidelines:

- 1. The GND, SW and the VIN trace should be kept short, direct and wide.
- 2. VFB pin must be connected directly to the feedback resistors. Resistive divider R1/R1 must be connected parallel to the output capacitor  $C_{\text{OUT}}$ .
- 3. The Input capacitor  $C_{\text{IN}}$  must be connected to the pin VIN as close as possible.
- 4. Keep SW node away from the sensitive VFB node since this node has high frequency and voltage swing.
- 5. Keep the (-) plates of  $C_{\text{IN}}$  and  $C_{\text{OUT}}$  as close as possible.
